

## **Baby Genius will soon be born!**

*(Parents, please see that the child understands what to do.*

1. Make a printout of Baby Genius.
2. Color the baby's skin any skin tone, your own for example.
3. Color the womb a pinkish tone.
4. Lightly color all around the womb to make soft, pastel hues of blue, yellow, pink, green, lavender, violet, purple, white, or any other pure, pastel color you may like.  
(Infants love being surrounded by soft, pastel colors, while intense colors and loud noises over-stimulate their sensitive nervous systems.)
5. Paste the colored picture of Baby Genius onto cardboard.
6. Place Baby Genius u right against the back of a couch or chair.
7. Print the flashcards from the links below.
8. As the child learns the letters, phonograms and words from the Home Reading Program, the child can show the flashcards that he knows to Baby Genius. The child teaching Baby Genius to read reinforces the child s reading skills.

*Note: Babies can be taught reading while in their mother's womb! All babies have genius potential because a baby is born with many more brain cells that he will ever use. The child who is loved and taught in the womb is born with more activated brain cells than the child who is not. Scientists know that the centers for extra sensory perception are located in the right hemisphere of the brain. Babies in the womb have highly active right brains, while their left-brain is dormant because it is undeveloped. There is much anecdotal evidence revealing that the preborn baby has heightened extra sensory perception. Every opportunity you give a baby for learning will increase his intelligence potential!*
